

## EHS-1™

The electric hand switch (EHS-1) is the simplest way to control any electrically triggered controller or actuator from Action Target. The rugged aluminum handle houses an on/off button that can easily be pressed with the thumb as the unit is held in the palm of the hand. The EHS is also available in a momentary push button option. The electrical connection on the EHS-1 is identical to the PRO-INT shot timer. This makes it easy to upgrade later as a more sophisticated range controller becomes necessary.

It is important to note that the EHS-1 does not physically control air flow to the targets. It sends a simple electric signal to a separate interface such as the TI-1 that in turn controls the air flow and activates the target.

**What comes with the EHS-1:**

This controller comes as a single, hand-held unit.

**What else you need:**

- Air flow controller (like the TI-1),
- Target actuators to control
- 12 volt power
- All necessary cords, cables, and hoses.
