

CONTROL SYSTEMS

HS-1™

Every target system has to have an operator. Someone has to press a button, step on a board, shoot down a plate, or open a door to make a target function. Controllers form the link between a human operator and the rest of the system, allowing these actions to be performed. Action Target offers the most innovative, most practical, and most powerful controllers you will find anywhere.

The HS-1 hand switch is the simplest of all Action Target controllers. Even so, this versatile control module gets used again and again to fill a need that can be met in no other way. The HS-1 serves as a manual air flow interface that allows you to operate any of Action Target's pneumatic actuators. Squeeze the button and the target turns. Let go of the button and the target turns back - it's that easy.

The HS-1 has an air supply input, a "normally-on" output and a "normally-off" output. In the normal condition, the air pressure at the supply input is connected internally to the N-ON output. When the button is pressed, the air supply input becomes connected internally to the N-OFF output. A version of the HS-1, called the KDS-1, is available for steel targets. This switch attaches to the actuator, and is pushed by the action of the target falling over.

What comes with the HS-1:

- This controller comes as a single, hand-held unit.

What else you need:

- Air supply
- Target actuators
- All necessary cords, cables, and hoses.
